

Trade Operations Reconciliation & Break Analysis

Objective:

Simulate post-trade reconciliation between internal and broker trade records to identify operational breaks, monitor settlement discrepancies, and analyze reconciliation accuracy across multiple asset classes.

Project Scope:

This project simulates a trade operations workflow involving trade capture, broker comparison, reconciliation, break identification, and operational reporting.

Asset Class Covered:

- Equity
- ETF
- Fixed Income
- Derivatives

Key Functions Performed:

- Trade Reconciliation
- Break Identification
- Exception Reporting
- Quantity & Price Validation
- Missing Trade Detection
- Dashboard Reporting

Tools Used:

- Microsoft Excel
- VLOOKUP
- IF Statements
- Pivot Tables
- Charts & Dashboard Reporting

Key Findings:

- Identified quantity, price, and missing trade breaks between internal and broker datasets.
- Simulated operational risk scenarios through reconciliation exceptions.
- Built dashboards to monitor break percentages and trade activity.
